

Download How Do Bats See In The Dark

Bats maneuver in the dark using their eyes and a process called echolocation. Echolocation refers to the process of using echoes and sound waves to navigate around objects. Using echolocation, bats are able to avoid bumping into objects as they fly in the dark. Many species of bats live in dark caves but not all of them rely on vision for hunting and moving around but as many as half the species of bats out of some 900 use a trick called echolocation[3]. They use echolocation for traveling, avoiding obstacles and also hunting food. Usually all bats catch their prey through echo-location. Some bats like the fruit bat can see in light as clearly as we do. Though no bat has been found yet that can see in the dark like cats. But ... The bats insects that fly at night, a single brown bat can catch up to 600 insects in an hour. Bats are upside down sleep, when bats settle down for a long day's rest, they fold their wings around themselves and hang upside down in a cave or other dark place. many bats is rest together, large fruit bats often hang from branches, like pieces of fruit, other bats dangle from ledges or tree trunks.
